ABILITY TO
VERIFY ITS
PERFORMANCE.

BY JIM WILLIAMS AND GUY HOOVER • LINEAR TECHNOLOGY

The ability to faithfully digitize a sine wave is a sensitive test of high-resolution-ADC fidelity. This test requires a sine-wave generator with residual distortion products approaching 1 ppm (part per million). It also requires a computer-based ADC-output monitor to read and display the converter's output spectral components. Performing this testing at reasonable cost and complexity requires the construction of its elements and performance verification before its use. A low-distortion oscillator drives the ADC through an amplifier (Figure 1). The ADC's output interface formats the converter output, which communicates with the computer. The computer executes spectral-analysis software and displays the resulting data.

Accurate and Robust Spectral Testing with Relaxed Instrumentation Requirements Yuming Zhuang, Degang Chen, 2018-04-03 This book introduces a family of new methods for accurate and robust spectral testing and fills an information gap as the requirements in standard test have grown increasingly challenging in recent high precision testing especially as the device performance has continued to improve Test engineers will be enabled to accurately set their devices systems at much simpler test setup much reduced complexity and much lower cost

A Re-configurable Pipeline ADC Architecture with Built-in Self-test Techniques Hui Liu, 2001 This basic algorithm can be applied to many pipeline analog systems The proposed grouping algorithm cuts down the number of evaluation permutation from thousands to 18 for a 9 bit ADC thus allowing the method to be used in real applications To validate the developments of this dissertation a 40MS s 9 bit re configurable pipeline ADC was designed and implemented in TSMC s 0 25 Mu m single poly CMOS digital process This includes a fully differential folded cascade gain boosting operational amplifier was high gain and high unity gain bandwidth The experimental results strongly support the effectiveness of re configuration algorithm which provides an average of 0 5bit ENOB improvement among the set of configurations For many applications this is a very significant performance improvement The BIST and re configurability techniques proposed are not limited to pipeline ADCs only The BIST methodology is applicable to many analog systems and the re configurability is applicable to any analog pipeline system

Design of a Highly Constrained Test System for a 12-bit, 16-channel Wilkinson ADC Zachary William Pannell, 2009 Outer space is a very harsh environment that can cause electronics to not operate as they were originally intended Aside from the extreme amount of radiation found in space temperatures can also change very dramatically in a relatively small time frame In order to test electronics that will be used in this environment they first need to be tested on Earth under replicated conditions Vanderbilt University designed a dewar that allows devices to be tested at these extreme temperatures while being radiated For this thesis a test setup that met all of the dewar s constraints was designed that would allow a 12 bit 16 channel analog to digital converter to be tested while inside

A High Resolution 14-bit ADC for Gammasphere Project, 1992 A system of 110 high performance A D converters required for the Gammasphere Project at the Lawrence Berkeley Laboratory is described The ADCs are compact linear plus minus 0 006% integral plus minus 0 5% differential with a conversion deadtime of 5 3 mu s and channel profile flatness of 50% over a 13 bit range The converter is based on a new low power 0 25 W low cost monolithic high speed sampling ADC exhibiting a very high stability and no missing codes over the entire 16 bit range Differential linearity was achieved by applying the Gatti method covering a 8 bit range Measured data and methods of testing the ADC are also resented
