*Brain-powered Science* Thomas O'Brien, 2010

How can a long metal needle pass through a balloon without popping it How can water flow at very different rates through two identical funnels How can a stick placed on a table under several sheets of newspaper and extended over the edge of a table snap when quickly struck without lifting or tearing the paper Author Thomas O Brien takes these and 30 more science inquiry activities to a higher level in this book for educators who love to surprise and challenge their students with unanticipated results Using experiments based on the science of a discrepant event an experiment or demonstration in which the outcome is not what students expect O Brien shows how learners can be motivated to reconsider their preconceived notions and think more closely about what has actually occurred and the underlying scientific explanations What makes this volume more valuable than a mere activity book is the addition of a science education component to the extensive science content found in each activity Each discrepant event is shown to be analogous to a pedagogical principle Speaking directly to teachers O Brien writes Your participation as teacher as learner experimenter rather than simply passive reader in these minds on activities will lead you to question and help you to revise your implicit assumptions about the nature of science teaching and learning At the same time you will develop expertise with activities that you can use with your own students The dual purpose activities thus allow you to unlock two doors with one key the doors to your own learning and to your students learning The detailed analogies between the activities and science learning make the book an ideal resource for middle and high school teachers science teacher educators and their preservice students and professional development specialists alike This thorough and thought provoking text includes more than 200 up to date internet resources as well as extensions to each of the physical science biology and chemistry activities bringing the total number of inquiry activities to nearly 120 Most important the author reminds teachers that the study of science is full of surprises and should be both meaningful and fun for students

**The Design Productivity Debate** Alex H.B. Duffy, 2012-12-06 Over the past decade with greater emphasis being placed upon shorter lead times better quality products reduced product costs and greater customer satisfaction the topic of Engineering Design

has received increased interest from the industrial and academic communities. Considerable effort has been directed at developing design process methodologies and building computer tools that focus upon relatively narrow aspects of design but many key problems in Engineering Design research and practice remain unanswered. Resulting from the First International Engineering Design Debate held in Glasgow UK in late 1996, this volume discusses the main issues concerning the improvement of design productivity. Covering design studies, design development, concurrent engineering and design knowledge and information, it attempts to derive a common understanding of the basic factors, problems and potential solutions involved.

**e-Learning Initiatives in China** Helen Spencer-Oatey, 2007-08-01. e-Learning Initiatives in China provides research and application insights into e-learning in China in the light of two drives by the Chinese Ministry of Education to implement curriculum reform and to promote quality and innovation in e-learning provision. Educationalists throughout the world have their eyes on China both as a market to understand and to enter and as a major source of international students. In addition, educationalists are increasingly aware of the need to incorporate digital technology into their course provision and delivery. This book provides valuable insights into both of these elements. It includes state-of-the-art reviews of e-learning in China, case study examples of e-learning design and development issues and explores the collaboration challenges that British and Chinese teams experienced as they participated in a Sino UK e-learning initiative, the eChina UK Programme. The book is written in a clear and accessible style. Section 1, Background, introduces the book and provides an overview of e-learning in higher education in China. Section 2, Designing and Delivering Online Courses in China, starts with a critical review of online courseware designs that are currently widespread in China and then presents a series of case study examples which deal with important design and delivery issues. Section 3, Managing the Interplay between Pedagogy and Technology, explores ways in which new learning technologies can be exploited for pedagogic purposes. Section 4, Managing Collaboration Processes, discusses the issues that the project teams needed to manage effectively as they collaborated both internationally and professionally. The final section, Section 5, Addressing Policy Issues, deals with key e-learning policy issues both within China and internationally. The topic of e-learning combined with the book's emphasis on the interrelationship of policy and practice and its international teamwork perspective will appeal to education specialists and e-learning experts not only in Asia but also in many Western countries.

**The Chemical News and Journal of Physical Science**, 1870. **Turbulence in Fluids**

Marcel Lesieur, 2008-03-26. Turbulence is a dangerous topic which is often at the origin of serious fights in the scientific meetings devoted to it since it represents extremely different points of view all of which have in common their complexity as

well as an inability to solve the problem It is even difficult to agree on what exactly is the problem to be solved Extremely schematically two opposing points of view had been advocated during these last thirty years the first one was statistical and tried to model the evolution of averaged quantities of the flow This community which had followed the glorious trail of Taylor and Kolmogorov believed in the phenomenology of cascades and strongly disputed the possibility of any coherence or order associated to turbulence On the other bank of the river stood the coherence among chaos community which considered turbulence from a purely deterministic point of view by studying either the behaviour of dynamical systems or the stability of flows in various situations To this community were also associated the experimentalists and computer simulators who sought to identify coherent vortices in flows Situation is more complex now and the existence of these two camps is less clear In fact a third point of view pushed by people from the physics community has emerged with the concepts of renormalization group theory multifractality mixing and Lagrangian approaches
