## Types of Heat Transfer

Temperature differences are not as we realize for the air conditions convection, and radiation.

Convection is heat transfer by the movement of the fluid. As air is heated, it expands and becomes less dense. This is because the air molecules are taking up more space. This makes the air rise and the cooler air sinks. Convection also occurs in liquids. Convection also occurs in solids as you can see in the diagram. Cooler water

Radiation is heat transfer by the form of electromagnetic waves. Thermal energy is transferred by waves, causing the particles to vibrate.

## Particle Arrangement

To understand how heat moves, we need to know how the particles are arranged. On Earth, all matter is made up of particles. These particles are always moving.

Figure 1.1: Particles in a solid

## Thermal Equilibrium

Particles are always vibrating and this vibrating motion produces thermal energy. All matter is constantly vibrating, so all matter has some amount of thermal energy. Heat transfer is how thermal energy moves from one place to another. Lucky for us, it is easy to predict how heat moves. Thermal energy will always travel from warmer objects to cooler objects until the energy is equally distributed. When you have two objects that are at different temperatures, thermal energy moves from the warmer object to the cooler object until they are both at the same temperature. This is called thermal equilibrium. Thermal energy continues to move until equilibrium is established, returning to its resting thermal equilibrium.
