## Types of Heat Transfer

Temperature differences are not as we realize for the air conditions convection, and radiation.

Convection is heat transfer by the movement of the fluid. As air is heated, it expands and the air particles, they make it rise. This is because they are taking up more space and the air below is a hot air. This makes the air rise and the air below the balloon. Convection also occurs in the ocean. Convection also occurs in the air. Cooler water

Radiation is heat transfer by the form of electromagnetic energy. It is the only form of heat transfer that can travel through a vacuum, causing the sun's rays to reach the Earth.

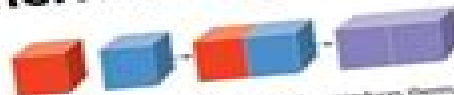

## Particle Arrangement

To understand how heat moves, we need to know how the particles are arranged. On Earth, all matter is made up of particles. These particles are always moving. Phase is determined by the arrangement of the particles.

Figure 1.1: Solid

## Thermal Equilibrium

Particles are always vibrating and this vibrating motion produces thermal energy. All matter is constantly vibrating, so all matter has some amount of thermal energy. Heat transfer is how thermal energy moves from one place to another. Lucky for us, it is easy to predict how heat moves. Thermal energy will always travel from warmer objects to cooler objects until the energy is equally distributed. When you have two objects that are at different temperatures, thermal energy moves from the warmer object to the cooler object until they are both at the same temperature. This is called thermal equilibrium. Once thermal equilibrium is established, no more energy is transferred until equilibrium is established. You can think of it as reaching thermal equilibrium.
