### Energy

Heat is the flow of **thermal energy**.

**A campfire** has the fastest moving particles.

In order for conduction to occur, two objects must be **touching**.

Study the diagram below:

A glass baking dish will crack if moved from a very hot oven directly into the freezer. This is because **heat causes matter to expand, and cold causes matter to contract**. When a very hot object like glass is cooled off too quickly, it contracts fast and cracks.

Humans produce sound when their vocal chords **vibrate**.

The distance from the top of one sound wave to the top of the next sound wave is called a **wavelength**.

The loudness or softness of sound is called **volume**.

Sonar measures underwater distances by using **echoes**.

Do you think that sound would travel faster through wood or water? **Sound would travel faster through wood. Sound is created when particles bump into each other. Since particles in a solid are closer together than water particles, sound travels faster through wood.**

The following statement is NOT true about white light: **it contains only yellow and blue.**

Sunburn is caused by **ultraviolet light**.

Ambiguities in Decision-oriented Life Cycle Inventories Frank Werner,2006-03-30 In an environmental life cycle assessment of products LCA an unambiguous scientifically based objective attribution of material and energy flows to a product is pure fiction This is due to the fundamental epistemological conditions of LCA as a modelling process under the complexity of our socio economic system Instead various mental models and values guide this attribution This leads to a functional model in a specific decision situation This book shows for the first time how mental models and values influence this attribution in the life cycle inventory step of LCA One of the key findings is that the different management rules for a

sustainable use of materials must be taken into account for the attribution of material and energy flows to a product. Otherwise improvement options recommended by an LCA might turn out to even worsen the environmental situation if reassessed from a meta perspective. As a consequence of this book the claim of unambiguity objectivity of the life cycle inventory must be abandoned. A group model building process for LCA is developed that allows one to grasp the decision makers mental models and values in the inventory analysis on a case and situation specific basis. Only by this LCA results will become relevant in a decision making process. Two case studies on the modelling of recycling and other end of life options of aluminium windows and beech wood railway sleepers in LCA complement the methodological part. This book is a must have for researchers consultants and practitioners in the fields of decision oriented life cycle assessment as well as product related environmental management modelling and decision making.
