

18. Explain the following:

- Water pipes in colder countries often burst in winter.
- In winter, water tank (or ocean) starts freezing from the surface and not from the bottom
- Fishes survive in ponds even when the atmospheric temperature is below 0°C
- A hollow glass sphere which floats with its entire volume submerged in water at 4°C, sinks when water is heated above 4°C.
- A glass bottle completely filled with water and tightly closed at room temperature, is likely to burst when kept in the freezer of a refrigerator.

Solution:

- The atmospheric pressure on winter nights drops below 4°C causing the water enclosed in the pipe lines to expand and exert a huge pressure on the pipe, hence the bursting
- The temperature drops in winters causing the surface of the tank to contract and become dense and sink to the base. A circulation is hence set up till the intact water in the tank touches the maximum density at 4°C. Further fall in temperature causes the upper most layer to expand and remains there until it is frozen. Consequently, water in the tank freezes from the top and not from the base.
- During colder weathers, the aquatic life is preserved by the anomalous expansion of water. The topmost layer in the pond contracts when the temperature drops, hence becomes denser and sinks to the bottom. Until the water touches maximum density at 4°C, the circulation is set up. Drop in temperature causes the top layer to expand and remain at the top until it freezes. Hence, though the upper layer is frozen, the water at the base is at 4°C, hence the fishes can easily survive.
- The density of water decreases on heating water above 4°C. Consequently, the upthrust or the upward force that acts on the water as a result of the water upon the hollow glass sphere decreases, causing it to sink.
- When the temperature of the water falls below 4°C inside the freezer, the water inside the bottle starts expanding. In case the bottle is filled completely and secured tightly, water cannot expand, hence it may burst.
