Brechet,2019-01-03 In this introductory textbook thermodynamics is presented as a natural extension of mechanics so that the laws and concepts learned in mechanics serve to get acquainted with the theory The foundations of thermodynamics are presented in the first part The second part covers a wide range of applications which are of central importance in the fields of physics chemistry and engineering including calorimetry phase transitions heat engines and chemical reactions In the

third part devoted to continuous media Fourier and Fick's laws diffusion equations and many transport effects are derived using a unified approach Each chapter concludes with a selection of worked examples and several exercises to reinforce key concepts under discussion A full solutions manual is available at the end of the book It contains more than 150 problems based on contemporary issues faced by scientists and engineers that are solved in detail for undergraduate and graduate students

Stochastic Thermodynamic Treatment of Thermal Anisotropy Olga Movilla Miangolarra, 2024-10-24 This thesis advances our understanding of how thermal anisotropy can be exploited to extract work through a mechanism that is quite distinct from the classical Carnot heat engine Anisotropy the presence of thermal or chemical gradients is ubiquitous in the real world and powers the cascade of processes that sustain life The thesis quantifies for the first time the maximum amount of power and efficiency that a suitable mechanism a Brownian gyrator can achieve in such conditions An important contribution at the center of the thesis is to lay out a geometric framework that brings out the importance of an isoperimetric problem to analyze and quantify optimal operation of thermodynamic engines that harvest energy when simultaneously in contact with several heat baths Fundamental bounds are derived via isoperimetric inequalities which capture the trade off between work and dissipation that accrue during thermodynamic cycles A geometric theory that allows such insights is explained first the theory of optimal mass transport followed by rudiments of stochastic thermodynamics that allow for quantification of work and entropy production during finite time thermodynamic transitions The thesis further explores entropy production due to heat flowing between heat baths of different temperature through the system dynamics and concludes with analysis as a proof of concept of an autonomous engine that harvests energy from a thermal gradient to continuously produce work in a stable limit cycle operation
