Landscape Evolution Jonathan D. Phillips, 2021-04-30 Landscape Evolution Landforms Ecosystems and Soils asks us to think holistically to look for the interactions between the Earth's component surface systems to consider how universal laws and historical and geographical contingency work together and to ponder the implications of nonlinear dynamics in landscapes ecosystems and soils Development evolution landforms topography soils ecosystems and hydrological systems are inextricably intertwined While empirical studies increasingly incorporate these interactions theories and conceptual frameworks addressing landforms soils and ecosystems are pursued largely independently This is partly due to different academic disciplines traditions and lexicons involved and partly due to the disparate time scales sometimes encountered Landscape Evolution explicitly synthesizes and integrates these theories and threads of inquiry arguing that all are guided by a general principle of efficiency selection A key theme is that evolutionary trends are probabilistic emergent outcomes of efficiency selection rather than purported goal functions This interdisciplinary reference will be useful for academic and research scientists across the Earth sciences Serves as a primary theoretical resource on landscape evolution Earth surface system development and environmental responses to climate and land use change Incorporates key ideas on geomorphic soil hydrologic and ecosystem evolution and responses in a single book Includes case studies to provide real world examples of evolving landscapes

The Regulation of Peace River Michael Church, 2014-12-31 This book presents a comprehensive overview of the first longitudinal study of the downstream response of a major river to the establishment of a large hydropower facility and dams Peace River a northward flowing boreal river in northwestern Canada was dammed in 1967 and the book describes the morphological response of the 1200 km downstream channel and the response of riparian vegetation to the change in flow regime over the first forty years of regulated flows Beginning with a description of the effect of regulation on the flow and sediment regimes of the river the book proceeds to study changes in downstream channel geometry on the main stem on the lowermost course of tributaries and on the hydraulic geometry the overall morphology of

the channel and riparian vegetation succession The river is subject to annual freeze up and break up so a chapter is devoted to the ice regime of the river A chapter compares the effects of two extraordinary post regulation flood events The penultimate chapter presents a prediction of the ultimate equilibrium form of the regulated river based on rational regime theory An online database of all the main observations will provide invaluable material for advanced students of river hydraulics and geomorphology This book carefully brings together a range of studies that have been previously inaccessible providing a rare and comprehensive analysis of the effects of a big dam on a river a river that itself represents an example of the kind of system that is likely to receive considerable attention in the future from dam engineers and environmentalists An invaluable reference to river scientists hydroelectric power developers engineers and environmentalists Focus on a northward flowing boreal river a type that holds most of the remaining hydroelectric power potential in the Northern Hemisphere Exceptional separation of water and sediment sources permitting study of the isolated effect of manipulating one of the two major governing conditions of river processes and form Unique example of water regulation and both natural and engineered flood flows Detailed study of both morphological changes of the channel and of the riparian vegetation Online data supplement including major data tables and numerous maps Details of the main observations and provides material for problem study by advanced students of river hydraulics and geomorphology are provided
