

The Organic Codes – an introduction to semantic biology

By Marcello Barbieri*

Cambridge: Cambridge University Press, 2003, pp 312. ISBN 0521531004

After an interval of almost two decades*, Marcello Barbieri has released his second book on evolutionary biology. He is not only courageous but careful; two previous versions of the book have been available to a smaller circle of readers. This approach is the result of his interdisciplinary nature, for although being primarily an embryologist he is also accomplished in mathematics, molecular biology, evolutionary theory and philosophy.

In this book, Barbieri is trying to bridge the gap between several famous dichotomies, i.e. the body and mind dichotomy described by Descartes in the Seventeenth century, the dichotomy of genotype and phenotype noted in the early Twentieth century, the genomic strings and spatial structure of proteins dichotomy first breached in the mid-Twentieth century and still not fully solved, the computer hardware and software dichotomy, and the dichotomy between the present information-based theories of life and the 'vital energies' theories of the Nineteenth century.

The difficulty is that the derived properties are more complex than what produces them and the problem becomes one of building three-dimensional systems 'from incomplete information' in a process akin to *epigenesis*. The author approaches this problem by using a model inspired by procedures taken from tomography, where complex forms are generated from two-dimensional projections. The model, which Barbieri applied to biological processes, was developed by him almost three decades ago and involves 'memory matrices' (memory systems, not always well defined, but modeled as matrices) and 'conventional codes' (it is implied that all codes are conventional). This model supplements the traditional biochemical catalysis mechanisms, which are qualified as informatic, with codified mechanisms. The latter are able to give semantic meaning to organic processes.

The early evolutionary path was from a minimal cell, whose origin, and thus the origin of life, coincided with the appearance of the genetic code. The cell is defined as an autopoietic and *epigenetic* system, with at least one organic memory (the genome) and at least one organic code (the genetic code). In epigenesis, the added complexity arises through reconstruction from incomplete information, and evolution occurred by natural selection and natural conventions (the codes).

Microorganisms were the only form of life for 3 billion years. The signal transduction code was already present in prokaryotes, eukaryotes adding the splicing codes. Multicellular organisms depended on cell adhesion codes, and the proliferation of these and other codes has taken place only over the last half a billion years. It is indicated that the organization of a single cell is much more complex than the developmental processes of multicellulars and that most of the crucial and basic evolutionary innovations had already occurred in unicellular organisms.

According to Barbieri, collective or organic memories are modeled as matrices developed in discontinuous stages and dependent on their respective codes. They go from, e.g., Spemann's determination mechanisms at the cellular or tissular stages, to Cuviers body plans or von Baers patterns at embryogenesis. Following the same line of argument the author suggests that the development of language is based on a linguistic code or 'mind plan', akin to the innate universal grammar suggested by Chomsky, encompassing the nature versus nurture, and the heredity versus environment dichotomies.

Barbieri's 'memory reconstruction method' is capable of increasing the complexity of a system and also functions as an anti-chaos mechanism. The processes work in a necessarily convergent way, for integration of tissues and organs into the system of multicellular organisms, a degree of divergence being added by phylogenetic processes. Codes for the organic (epigenetic) memory matrices can be used to reconstruct the 'real space' of the organic system, thereby reaching meaning.

Meaning becomes just the procedure through which an object can be related to another via a code. Codes are defined as conventional sets of rules that establish correspondence between two independent worlds. Information is the simple structure of signs, chemical radicals or words. These are individually arbitrary but acquiring meaning when integrated into a systemic collectivity through community laws. Meaning and semantics are always relative to the working system.

Transcription (catalyzed assembly) is only informatic, while translation is coded assembly. The codes have to be rigid enough to provide biological specificity. Barbieri assumes that the genetic code arose as a mechanism for the translation of mRNA strings. The world of RNA-derived proteins did not yet exist but came into being after the development of 'adaptors' (tRNAs), this protein
