The Origin And Evolution Of Mammals:

The Origin and Evolution of Mammals T. S. Kemp, 2005 Mammals are the dominant large animals of today occurring in virtually every environment This book is an account of the remarkable 320 million year long fossil record that documents their origin their long spell as no more than small nocturnal creatures and their explosive radiation since the extinction of the dinosaurs 65 million years ago Tom Kemp also unveils the exciting molecular evidence which coupled with important new fossils is presently challenging current thinking on the interrelationships and historical biogeography of mammals The Origin and Evolution of Mammals will be of interest to advanced undergraduate and graduate students as well as researchers in vertebrate palaeontology biogeography mammalian systematics and molecular taxonomy It will also be welcomed by vertebrate fossil enthusiasts and evolutionary biologists of all levels with an interest in macroevolutionary problems

The Origin and Evolution of Mammals Thomas Stainforth Kemp, 2005 The Synapsida are the mammal like reptiles and mammals a group that diverged from a common ancestor shared with reptiles and birds about 340 million years The fossil record of the synapsids is extraordinarily good and documents the three phases of the history of the group each one of which points to important evolutionary generalisations as well as relating an intrinsically fascinating story The first stage leads from the origin of the group to the earliest mammals The non mammalian synapsids constituted the first radiation of fully terrestrial vertebrates dominating the land long before the dinosaurs displaced them and took over that role The fossil record illustrates the relationship between this radiation and the environmental conditions of the Permo Triassic when it occurred It also illustrates to a far greater degree than any other fossil record the origin of a major new taxon The sequence of acquisition of mammalian structures and functions inferred from the fossils leads to an interpretation about the processes involved in the evolution of mammalian biological organisation The second stage is the Mesozoic history of mammals Throughout the Jurassic and Cretaceous Periods mammals remained small insectivorous or omnivorous animals living a nocturnal existence They were abundant and diverse but failed completely to evolve into any of the middle sized and large sized forms familiar amongst today's mammals This is usually though not completely satisfactorily explained by competitive exclusion by dinosaurs The third stage is the great Cenozoic radiation of mammals From the moment the dinosaurs disappeared 65 million years ago new kinds of mammals proceeded to evolve Medium and large bodied herbivore and carnivore groups appeared early and from then onwards a kaleidoscope of origins flourishings and extinctions of lineages of mammals took place This great story interweaves changing climates shifting continents ecological opportunities and the fulfilment of the adaptive potential of Mammalia The latest molecular evidence that is having a huge impact on ideas about the timing and origins of the modern mammalian taxa is discussed along with the fossil evidence The book reviews these three stages in turn bringing up to date the palaeontological evidence and incorporating the molecular taxonomic data that has been rapidly accumulating over the last few years and which is responsible for a series of exciting radical new ideas about

relationships amongst mammals and their inferred palaeo biogeographic history The Origin of Higher Taxa T.S. Kemp, 2015-12-16 In the grand sweep of evolution the origin of radically new kinds of organisms in the fossil record is the result of a relatively simple process natural selection marching through the ages Or is it Does Darwinian evolution acting over a sufficiently long period of time really offer a complete explanation or are unusual genetic events and particular environmental and ecological circumstances also involved With The Origin of Higher Taxa Tom Kemp sifts through the layers of paleobiological genetic and ecological evidence on a quest to answer this essential game changing question of biology Looking beyond the microevolutionary force of Darwinian natural selection Kemp enters the realm of macroevolution or evolution above the species level From the origin of mammals to the radiation of flowering plants these large scale patterns such as the rise of novel organismal design adaptive radiations and lineage extinctions encompass the most significant trends and transformations in evolution As macroevolution cannot be studied by direct observation and experiment scientists have to rely on the outcome of evolution as evidence for the processes at work in the form of patterns of species appearances and extinctions in a spotty fossil record and through the nature of species extant today Marshalling a wealth of new fossil and molecular evidence and increasingly sophisticated techniques for their study Kemp here offers a timely and original reinterpretation of how higher taxa such as arthropods mollusks mammals birds and whales evolved a bold new take on the history of life

Mammalian Evolution, Diversity and Systematics Frank Zachos, Robert Asher, 2018-10-22 There are nearly 6 000 mammalian species among them our own Research on our evolutionary cousins has a long history but the last 20 years have seen particularly rapid progress in disentangling the interrelationships and evolutionary history of mammals The present volume combines up to date reviews on mammalian phylogenetics with paleontological taxonomic and evolutionary chapters and also summarizes the historical development of our insights in mammalian relationships and thus our own place in the Tree of Life Our book places the present biodiversity crisis in context with one in four mammal species threatened by extinction and reviews the distribution and conservation of mammalian diversity across the globe This volume is the introductory tome to the new Mammalia series of the Handbook of Zoology and will be essential reading for mammalogists zoologists and conservationists alike

Mammals Thomas Stainforth Kemp, 2017 Relative newcomers within the story of evolution mammals are hugely successful and have colonized land water and air Tom Kemp discusses the great diversity of mammalian species and looks at how their very disparate characteristics physiologies and behaviours are all largely driven by one uniting factor endothermy or warm bloodedness

Mammal Teeth Peter S. Ungar, 2010-10-01 Winner 2010 PROSE Award for Excellence

in the Biological Sciences Professional and Scholarly Publishing division of the Association of American Publishers In this unique book Peter S Ungar tells the story of mammalian teeth from their origin through their evolution to their current diversity Mammal Teeth traces the evolutionary history of teeth beginning with the very first mineralized vertebrate structures half a billion years ago Ungar describes how the simple conical tooth of early vertebrates became the molars incisors and other forms we see in mammals today Evolutionary adaptations changed pointy teeth into flatter ones with specialized shapes designed to complement the corresponding jaw Ungar explains tooth structure and function in the context of nutritional needs The myriad tooth shapes produced by evolution offer different solutions to the fundamental problem of how to squeeze as many nutrients as possible out of foods The book also highlights Ungar s own path breaking studies that show how microwear analysis can help us understand ancient diets The final part of the book provides an in depth examination of mammalian teeth today surveying all orders in the class family by family Ungar describes some of the more bizarre teeth such as tusks and the mammal diversity that accompanies these morphological wonders Mammal Teeth captures the evolution of mammals including humans through the prism of dental change Synthesizing decades of research Ungar reveals the interconnections among mammal diet dentition and evolution His book is a must read for paleontologists mammalogists and anthropologists
