The Order Of The Trees:

Algorithms on Trees and Graphs Gabriel Valiente, 2013-04-17 Graph algorithms is a well established subject in mathematics and computer science Beyond classical application fields like approximation combinatorial optimization graphics and operations research graph algorithms have recently attracted increased attention from computational molecular biology and computational chemistry Centered around the fundamental issue of graph isomorphism this text goes beyond classical graph problems of shortest paths spanning trees flows in networks and matchings in bipartite graphs Advanced algorithmic results and techniques of practical relevance are presented in a coherent and consolidated way This book introduces graph algorithms on an intuitive basis followed by a detailed exposition in a literate programming style with correctness proofs as well as worst case analyses Furthermore full C implementations of all algorithms presented are given using the LEDA library of efficient data structures and algorithms Numerous illustrations examples and exercises and a comprehensive bibliography support students and professionals in using the book as a text and source of reference [A](#)

Modular Calculus for the Average Cost of Data Structuring Michel Schellekens, 2008-06-17 A Modular Calculus for the Average Cost of Data Structuring introduces MOQA a new domain specific programming language which guarantees the average case time analysis of its programs to be modular Time in this context refers to a broad notion of cost which can be used to estimate the actual running time but also other quantitative information such as power consumption while modularity

means that the average time of a program can be easily computed from the times of its constituents something that no programming language of this scope has been able to guarantee so far MOQA principles can be incorporated in any standard programming language MOQA supports tracking of data and their distributions throughout computations based on the notion of random bag preservation This allows a unified approach to average case time analysis and resolves fundamental bottleneck problems in the area The main techniques are illustrated in an accompanying Flash tutorial where the visual nature of this method can provide new teaching ideas for algorithms courses This volume with forewords by Greg Bollella and Dana Scott presents novel programs based on the new advances in this area including the first randomness preserving version of Heapsort Programs are provided along with derivations of their average case time to illustrate the radically different approach to average case timing The automated static timing tool applies the Modular Calculus to extract the average case running time of programs directly from their MOQA code A Modular Calculus for the Average Cost of Data Structuring is designed for a professional audience composed of researchers and practitioners in industry with an interest in algorithmic analysis and also static timing and power analysis areas of growing importance It is also suitable as an advanced level text or reference book for students in computer science electrical engineering and mathematics Michel Schellekens obtained his PhD from Carnegie Mellon University following which he worked as a Marie Curie Fellow at Imperial College London Currently he is an Associate Professor at the Department of Computer Science in University College Cork National University of Ireland Cork where he leads the Centre for Efficiency Oriented Languages CEOL as a Science Foundation Ireland Principal Investigator Report of cases argued and determined in the Supreme Court of the State of Idaho ,1912

Structure-Preserving Algorithms for Oscillatory Differential Equations II Xinyuan Wu,Kai Liu,Wei Shi,2016-03-03 This book describes a variety of highly effective and efficient structure preserving algorithms for second order oscillatory differential equations Such systems arise in many branches of science and engineering and the examples in the book include systems from quantum physics celestial mechanics and electronics To accurately simulate the true behavior of such systems a numerical algorithm must preserve as much as possible their key structural properties time reversibility oscillation symplecticity and energy and momentum conservation The book describes novel advances in RKN methods ERKN methods Filon type asymptotic methods AVF methods and trigonometric Fourier collocation methods The accuracy and efficiency of each of these algorithms are tested via careful numerical simulations and their structure preserving properties are rigorously established by theoretical analysis The book also gives insights into the practical implementation of the methods This book is intended for engineers and scientists investigating oscillatory systems as well as for teachers and students who are interested in structure preserving algorithms for differential equations
